SUBSTITUTED PYRAZINONE COMPOUNDS  
FOR THE TREATMENT OF INFLAMMATION

## CROSS-REFERENCE TO RELATED APPLICATION

- 5           **[0001]**   This application claims the benefit of U.S. Provisional Application Serial No. 60/510,870, filed October 14, 2003, the contents of which are hereby incorporated by reference in their entirety.

## FIELD OF THE INVENTION

- 10           **[0002]**   This invention generally relates to anti-inflammatory pharmaceutical agents and specifically relates to pyrazinone compounds as inhibitors of IKK-2, an I $\kappa$ B kinase. The invention is further related to compositions comprising such compounds, and methods for treating cancer, inflammation, and inflammation-associated disorders such as arthritis.

## BACKGROUND OF THE INVENTION

- [0003]**   Rheumatoid arthritis is a common inflammatory disease affecting approximately 1% of the population. The disease is characterized by multiple painful swollen joints that severely limit the patient's daily function, and
- 20   can progress to the destruction of the affected joints. A common treatment for rheumatoid arthritis is anti-inflammatory steroids. Steroids are clinically very effective, but are limited in their use because of multiple severe side-effects. Thus, a need exists for an anti-rheumatoid arthritis treatment that offers the potency of steroids without the associated toxicity. One of the mechanisms by
- 25   which steroids exert their broad spectrum anti-inflammatory action is by inhibiting the activation of the transcription factor NF- $\kappa$ B. NF- $\kappa$ B plays a prominent role in immune and inflammatory responses by regulating the transcription of many early, inducible genes in a variety of cells including inflammatory enzymes such as COX-2 (i.e., cyclooxygenase-2) and iNOS (i.e.,
- 30   inducible nitric oxide synthase). NF- $\kappa$ B is sequestered in an inactive form in the

cytoplasm by a member of the I $\kappa$ B family of inhibitory proteins, and this prevents gene transcription of these responsive genes in the nucleus. Stimulation of cells leads to the phosphorylation, ubiquitination and degradation of I $\kappa$ B thereby releasing NF- $\kappa$ B to the nucleus for activation of gene transcription. Chronic  
5 activation of NF- $\kappa$ B has been demonstrated in vascular endothelium and synovial lining cells from patients with RA. Recently the I $\kappa$ B kinases (IKK-1 and IKK-2), which phosphorylate I $\kappa$ B and thereby initiate its degradation, have been cloned and initially characterized; these kinases appear to represent the critical, common denominator in the activation of NF- $\kappa$ B since antisense or dominant-  
10 negative IKK constructs block NF- $\kappa$ B nuclear translocation and inhibit NF- $\kappa$ B linked reported genes. Therefore, IKK-1 and/or IKK-2 represent novel and powerful targets for drug development.

[0004] It has been reported that selective IKK-2 inhibitors could be useful for the treatment of inflammatory diseases. See, e.g., Karin et al., Nat. Revs. 3, 17-26, 2004.

adchnon, amifostine analogues, detox, dimesna, I-102, MM-159, N-acylated-dehydroalanines, TGF-Genentech, tiprotimod, amifostine, WR-151327, FUT-187, ketoprofen transdermal, nabumetone, superoxide dismutase (Chiron) and superoxide dismutase Enzon.

5           **[0054]**   The compounds of the present invention may also be useful in treatment or prevention of angiogenesis-related disorders or conditions, for example, tumor growth, metastasis, macular degeneration, and atherosclerosis.

**[0055]**   In a further embodiment, the present invention also provides therapeutic combinations for the treatment or prevention of ophthalmic disorders  
10   or conditions such as glaucoma. For example the present inventive compounds advantageously may be used in therapeutic combination with a drug which reduces the intraocular pressure of patients afflicted with glaucoma. Such intraocular pressure-reducing drugs include without limitation latanoprost, travoprost, bimatoprost, or unoprostol. The therapeutic combination of a  
15   compound of the present invention plus an intraocular pressure-reducing drug may be useful because each is believed to achieve its effects by affecting a different mechanism.

**[0056]**   In another combination of the present invention, the present inventive compounds can be used in therapeutic combination with an  
20   antihyperlipidemic or cholesterol-lowering drug such as a benzothiepine or a benzothiazepine antihyperlipidemic drug. Examples of benzothiepine antihyperlipidemic drugs useful in the present inventive therapeutic combination can be found in U.S. Patent No. 5,994,391, herein incorporated by reference. Some benzothiazepine antihyperlipidemic drugs are described in PCT  
25   Publication No. WO 93/16055. Alternatively, the antihyperlipidemic or cholesterol-lowering drug useful in combination with a compound of the present invention can be an HMG Co-A reductase inhibitor. Examples of HMG Co-A reductase inhibitors useful in the present therapeutic combination include, individually, benfluorex, fluvastatin, lovastatin, pravastatin, simvastatin,

atorvastatin, cerivastatin, bervastatin, ZD-9720 (described in PCT Publication No. WO 97/06802), ZD-4522 (CAS No. 147098-20-2 for the calcium salt; CAS No. 147098-18-8 for the sodium salt; described in European Patent No. EP 521471), BMS 180431 (CAS No. 129829-03-4), or NK-104 (CAS No. 141750-63-2). The therapeutic combination of a compound of the present invention plus an antihyperlipidemic or cholesterol-lowering drug may be useful, for example, in reducing the risk of formation of atherosclerotic lesions in blood vessels. For example, atherosclerotic lesions often initiate at inflamed sites in blood vessels. It is established that antihyperlipidemic or cholesterol-lowering drug reduce risk of formation of atherosclerotic lesions by lowering lipid levels in blood. Without limiting the invention to a single mechanism of action, it is believed that one way the compounds of the present combination may work in concert to provide improved control of atherosclerotic lesions by, for example, reducing inflammation of the blood vessels in concert with lowering blood lipid levels.

15       **[0057]** In another embodiment of the invention, the present compounds can be used in combination with other compounds or therapies for the treatment of central nervous conditions or disorders such as migraine. For example, the present compounds can be used in therapeutic combination with caffeine, a 5-HT-1B/1D agonist (for example, a triptan such as sumatriptan, naratriptan, zolmitriptan, rizatriptan, almotriptan, or frovatriptan), a dopamine D4 antagonist (e.g., sonopiprazole), aspirin, acetaminophen, ibuprofen, indomethacin, naproxen sodium, isometheptene, dichloralphenazone, butalbital, an ergot alkaloid (e.g., ergotamine, dihydroergotamine, bromocriptine, ergonovine, or methyl ergonovine), a tricyclic antidepressant (e.g., amitriptyline or nortriptyline), a serotonergic antagonist (e.g., methysergide or cyproheptadine), a beta-adrenergic antagonist (e.g., propranolol, timolol, atenolol, nadolol, or metoprolol), or a monoamine oxidase inhibitor (e.g., phenylzine or isocarboxazid).

**[0160]** The term "subject" for purposes of treatment includes any human or animal subject who is in need of the prevention of, or who has pain, inflammation and/or any one of the known inflammation-associated disorders. The subject is typically a human subject.

25       **[0167]**   Hemisalts of acids and bases may also be formed, for example, hemisulphate and hemicalcium salts.

**[0168]**   Pharmaceutically acceptable salts of compounds of Formula I may be prepared by one or more of three methods: (i) by reacting the compound of Formula I with the desired acid or base; (ii) by removing an acid- or base-

labile protecting group from a suitable precursor of the compound of Formula I or by ring-opening a suitable cyclic precursor, for example, a lactone or lactam, using the desired acid or base; or (iii) by converting one salt of the compound of Formula I to another by reaction with an appropriate acid or base or by means of  
5 a suitable ion exchange column. All three reactions are typically carried out in solution. The resulting salt may precipitate out and be collected by filtration or may be recovered by evaporation of the solvent. The degree of ionization in the resulting salt may vary from completely ionized to almost non-ionized.

[0169] The compounds of the invention may exist in both unsolvated  
10 and solvated forms. The term "solvate" is used herein to describe a molecular complex comprising the compound of the invention and a stoichiometric amount of one or more pharmaceutically acceptable solvent molecules, for example, ethanol. The term "hydrate" is employed when said solvent is water.

[0170] Included within the scope of the invention are complexes such  
15 as clathrates, drug-host inclusion complexes wherein, in contrast to the aforementioned solvates, the drug and host are present in stoichiometric or non-stoichiometric amounts. Also included are complexes of the drug containing two or more organic and/or inorganic components which may be in stoichiometric or non-stoichiometric amounts. The resulting complexes may be ionized, partially  
20 ionized, or non-ionized. For a review of such complexes, see Haleblan, J. Pharm. Sci., **64(8)**, 1269-1288 (1975).

[0171] Hereinafter all references to compounds of Formula I include references to salts, solvates and complexes thereof and to solvates and complexes of salts thereof.

25 [0172] The compounds of the invention include compounds of Formula I as hereinbefore defined, including all polymorphs and crystal habits thereof, prodrugs and isomers thereof (including optical, geometric and tautomeric isomers) as hereinafter defined and isotopically-labeled compounds of Formula I.

[0173] As indicated, so-called prodrugs of the compounds of Formula I are also within the scope of the invention. The term "prodrug" refers to a compound that is a drug precursor which, following administration to a subject and subsequent absorption, is converted to an active species *in vivo* via some process, such as a metabolic process. Other products from the conversion process are easily disposed of by the body. The more preferred prodrugs are those involving a conversion process that produces products that are generally accepted as safe.

[0174] Prodrugs in accordance with the invention can, for example, be produced by replacing appropriate functionalities present in the compounds of Formula I with certain moieties known to those skilled in the art as "pro-moieties."

[0175] Some examples of prodrugs in accordance with the invention include: (i) where the compound of Formula I contains a carboxylic acid functionality ( $-\text{CO}_2\text{H}$ ), an ester thereof, for example, a compound wherein the hydrogen of the carboxylic acid functionality of the compound of Formula I is replaced by  $\text{C}_1\text{-C}_8$  alkyl; (ii) where the compound of Formula I contains an alcohol functionality ( $-\text{OH}$ ), an ether thereof, for example, a compound wherein the hydrogen of the alcohol functionality of the compound of Formula I is replaced by  $\text{C}_1\text{-C}_8$  alkanoyloxymethyl; and (iii) where the compound of Formula I contains a primary or secondary amino functionality ( $-\text{NH}_2$  or  $-\text{NHR}$  where  $\text{R} \neq \text{H}$ ), an amide thereof, for example, a compound wherein, as the case may be, one or both hydrogens of the amino functionality of the compound of Formula I is/are replaced by  $\text{C}_1\text{-C}_{10}$  alkanoyl.

[0176] Further examples of replacement groups in accordance with the foregoing examples and examples of other prodrug types may be found in the aforementioned references.

[0177] Moreover, certain compounds of Formula I may themselves act as prodrugs of other compounds of Formula I.

**[0178]** Also included within the scope of the invention are metabolites of compounds of Formula I, that is, compounds formed *in vivo* upon administration of the drug. Some examples of metabolites in accordance with the invention include: (i) where the compound of Formula I contains a methyl group, an hydroxymethyl derivative thereof ( $-\text{CH}_3 \rightarrow -\text{CH}_2\text{OH}$ ); (ii) where the compound of Formula I contains an alkoxy group, an hydroxy derivative thereof ( $-\text{OR} \rightarrow -\text{OH}$ ); (iii) where the compound of Formula I contains a tertiary amino group, a secondary amino derivative thereof ( $-\text{NR}^a\text{R}^b \rightarrow -\text{NHR}^a$  or  $-\text{NHR}^b$ ); (iv) where the compound of Formula I contains a secondary amino group, a primary derivative thereof ( $-\text{NHR} \rightarrow -\text{NH}_2$ ); (v) where the compound of Formula I contains a phenyl moiety, a phenol derivative thereof ( $-\text{Ph} \rightarrow -\text{PhOH}$ ); and (vi) where the compound of Formula I contains an amide group, a carboxylic acid derivative thereof ( $-\text{CONH}_2 \rightarrow -\text{COOH}$ ).

**[0179]** Compounds of Formula I containing one or more asymmetric carbon atoms can exist as two or more stereoisomers. Where a compound of Formula I contains an alkenyl or alkenylene group, geometric cis/trans (or Z/E) isomers are possible. Where structural isomers are interconvertible via a low energy barrier, tautomeric isomerism ("tautomerism") can occur. This can take the form of proton tautomerism in compounds of Formula I containing, for example, an imino, keto, or oxime group, or so-called valence tautomerism in compounds which contain an aromatic moiety. It follows that a single compound may exhibit more than one type of isomerism.

**[0180]** Included within the scope of the present invention are all stereoisomers, geometric isomers and tautomeric forms of the compounds of Formula I, including compounds exhibiting more than one type of isomerism, and mixtures of one or more thereof. Also included are acid addition or base salts wherein the counterion is optically active, for example, d-lactate or l-lysine, or racemic, for example, dl-tartrate or dl-arginine.

**[0181]** Cis/trans isomers may be separated by conventional

techniques well known to those skilled in the art, for example, chromatography and fractional crystallization.

[0182] Conventional techniques for the preparation/isolation of individual enantiomers include chiral synthesis from a suitable optically pure precursor or resolution of the racemate (or the racemate of a salt or derivative) using, for example, chiral high pressure liquid chromatography (chiral HPLC).

[0183] Alternatively, the racemate (or a racemic precursor) may be reacted with a suitable optically active compound, for example, an alcohol, or, in the case where the compound of Formula I contains an acidic or basic moiety, a base or acid such as 1-phenylethylamine or tartaric acid. The resulting diastereomeric mixture may be separated by chromatography and/or fractional crystallization and one or both of the diastereoisomers converted to the corresponding pure enantiomer(s) by means well known to a skilled person.

[0184] Chiral compounds of the invention (and chiral precursors thereof) may be obtained in enantiomerically-enriched form using chromatography, typically HPLC, on an asymmetric resin with a mobile phase consisting of a hydrocarbon, typically heptane or hexane, containing from 0 to 50% by volume of isopropanol, typically from 2 to 20%, and from 0 to 5% by volume of an alkylamine, typically 0.1% diethylamine. Concentration of the eluate affords the enriched mixture.

[0185] Stereoisomeric conglomerates may be separated by conventional techniques known to those skilled in the art.

[0186] The present invention includes all pharmaceutically acceptable isotopically-labeled compounds of Formula I wherein one or more atoms are replaced by atoms having the same atomic number, but an atomic mass or mass number different from the atomic mass or mass number which predominates in nature.

[0187] Examples of isotopes suitable for inclusion in the compounds of the invention include isotopes of hydrogen, such as  $^2\text{H}$  and  $^3\text{H}$ , carbon, such as

$^{11}\text{C}$ ,  $^{13}\text{C}$  and  $^{14}\text{C}$ , chlorine, such as  $^{36}\text{Cl}$ , fluorine, such as  $^{18}\text{F}$ , iodine, such as  $^{123}\text{I}$  and  $^{125}\text{I}$ , nitrogen, such as  $^{13}\text{N}$  and  $^{15}\text{N}$ , oxygen, such as  $^{15}\text{O}$ ,  $^{17}\text{O}$  and  $^{18}\text{O}$ , phosphorus, such as  $^{32}\text{P}$ , and sulphur, such as  $^{35}\text{S}$ .

[0188] Certain isotopically-labeled compounds of Formula I, for  
5 example, those incorporating a radioactive isotope, are useful in drug and/or substrate tissue distribution studies. The radioactive isotopes tritium ( $^3\text{H}$ ) and  $^{14}\text{C}$  are particularly useful for this purpose in view of their ease of incorporation and ready means of detection.

[0189] Substitution with heavier isotopes such as deuterium ( $^2\text{H}$ ) may  
10 afford certain therapeutic advantages resulting from greater metabolic stability, for example, increased *in vivo* half-life or reduced dosage requirements, and hence may be preferred in some circumstances.

[0190] Substitution with positron-emitting isotopes, such as  $^{11}\text{C}$ ,  $^{18}\text{F}$ ,  $^{15}\text{O}$   
and  $^{13}\text{N}$ , can be useful in Positron Emission Topography (PET) studies for  
15 examining substrate receptor occupancy.

[0191] Isotopically-labeled compounds of Formula I can generally be  
prepared by conventional techniques known to those skilled in the art or by  
processes analogous to those described in the accompanying Examples using  
an appropriate isotopically-labeled reagent in place of the non-labeled reagent  
20 previously employed.

[0192] Pharmaceutically acceptable solvates in accordance with the  
invention include those wherein the solvent of crystallization may be isotopically  
substituted, e.g.  $\text{D}_2\text{O}$ ,  $\text{d}_6$ -acetone, or  $\text{d}_6$ -DMSO.

[0193] Compounds of the invention intended for pharmaceutical use  
25 may be administered as crystalline or amorphous products. They may be obtained, for example, as solid plugs, powders, or films by methods such as precipitation, crystallization, freeze drying, spray drying, or evaporative drying. Microwave or radio frequency drying may be used for this purpose.

[0194] Generally, the compounds of the invention may be

administered as a formulation in association with one or more pharmaceutically acceptable excipients. The term "excipient" is used herein to describe any ingredient other than the compound(s) of the invention. The choice of excipient will to a large extent depend on factors such as the particular mode of  
5 administration, the effect of the excipient on solubility and stability, and the nature of the dosage form.

[0195] The compounds of the invention may be administered alone or in combination with one or more other compounds of the invention or in combination with one or more other drugs (or as any combination thereof). For  
10 example, compounds of Formula I may be used in co-therapies, partially or completely, in place of other conventional antiinflammatory therapies, such as together with other IKK-2 inhibitors, steroids, NSAIDs, COX-2 selective inhibitors, matrix metalloproteinase inhibitors, 5-lipoxygenase inhibitors, LTB<sub>4</sub> antagonists and LTA<sub>4</sub> hydrolase inhibitors.

15 [0196] Pharmaceutical compositions suitable for the delivery of compounds of the present invention and methods for their preparation will be readily apparent to those skilled in the art.

[0197] The compounds of the invention may be administered orally. Oral administration may involve swallowing, so that the compound enters the  
20 gastrointestinal tract, or buccal or sublingual administration may be employed by which the compound enters the blood stream directly from the mouth.

[0198] Formulations suitable for oral administration include solid formulations such as tablets, capsules containing particulates, liquids, or powders, lozenges (including liquid-filled), chews, multi- and nano-particulates,  
25 gels, solid solution, liposome, films, ovules, sprays and liquid formulations.

[0199] Liquid formulations include suspensions, solutions, syrups and elixirs. Such formulations may be employed as fillers in soft or hard capsules and typically comprise a carrier, for example, water, ethanol, polyethylene glycol, propylene glycol, methylcellulose, or a suitable oil, and one or more emulsifying

agents and/or suspending agents. Liquid formulations may also be prepared by the reconstitution of a solid, for example, from a sachet.

[0200] The compounds of the invention may also be used in fast-dissolving, fast-disintegrating dosage forms such as those described in Liang and Chen, Expert Opinion in Therapeutic Patents, **11(6)**, 981-986 (2001).

[0201] For tablet dosage forms, depending on dose, the drug may make up from 1 to 80 wt.% of the dosage form, more typically from 5 to 60 wt.% of the dosage form. In addition to the drug, tablets generally contain a disintegrant. Examples of disintegrants include sodium starch glycolate, sodium carboxymethyl cellulose, calcium carboxymethyl cellulose, croscarmellose sodium, crospovidone, polyvinylpyrrolidone, methyl cellulose, microcrystalline cellulose, lower alkyl-substituted hydroxypropyl cellulose, starch, pregelatinised starch and sodium alginate. Generally, the disintegrant will comprise from 1 to 25 wt.%, preferably from 5 to 20 wt.% of the dosage form.

[0202] Binders are generally used to impart cohesive qualities to a tablet formulation. Suitable binders include microcrystalline cellulose, gelatin, sugars, polyethylene glycol, natural and synthetic gums, polyvinylpyrrolidone, pregelatinised starch, hydroxypropyl cellulose and hydroxypropyl methylcellulose. Tablets may also contain diluents, such as lactose (monohydrate, spray-dried monohydrate, anhydrous and the like), mannitol, xylitol, dextrose, sucrose, sorbitol, microcrystalline cellulose, starch and dibasic calcium phosphate dihydrate.

[0203] Tablets may also optionally comprise surface active agents, such as sodium lauryl sulfate and polysorbate 80, and glidants such as silicon dioxide and talc. When present, surface active agents may comprise from 0.2 to 5 wt.% of the tablet, and glidants may comprise from 0.2 to 1 wt.% of the tablet.

[0204] Tablets also generally contain lubricants such as magnesium stearate, calcium stearate, zinc stearate, sodium stearyl fumarate, and mixtures of magnesium stearate with sodium lauryl sulphate. Lubricants generally

comprise from 0.25 to 10 wt.%, preferably from 0.5 to 3 wt.% of the tablet.

**[0205]** Other possible ingredients include anti-oxidants, colorants, flavoring agents, preservatives and taste-masking agents.

**[0206]** Exemplary tablets contain up to about 80% drug, from about 10  
5 to about 90 wt.% binder, from about 0 to about 85 wt.% diluent, from about 2 to about 10 wt.% disintegrant, and from about 0.25 to about 10 wt.% lubricant.

**[0207]** Tablet blends may be compressed directly or by roller to form tablets. Tablet blends or portions of blends may alternatively be wet-, dry-, or melt-granulated, melt congealed, or extruded before tableting. The final  
10 formulation may comprise one or more layers and may be coated or uncoated; it may even be encapsulated.

**[0208]** Consumable oral films for human or veterinary use are typically pliable water-soluble or water-swellaable thin film dosage forms which may be rapidly dissolving or mucoadhesive and typically comprise a compound of  
15 Formula I, a film-forming polymer, a binder, a solvent, a humectant, a plasticiser, a stabilizer or emulsifier, a viscosity-modifying agent and a solvent. Some components of the formulation may perform more than one function.

**[0209]** The compound of Formula I may be water-soluble or insoluble. A water-soluble compound typically comprises from 1 to 80 wt.%, more typically  
20 from 20 to 50 wt.%, of the solutes. Less soluble compounds may comprise a greater proportion of the composition, typically up to 88 wt.% of the solutes. Alternatively, the compound of Formula I may be in the form of multiparticulate beads.

**[0210]** The film-forming polymer may be selected from natural  
25 polysaccharides, proteins, or synthetic hydrocolloids and is typically present in the range 0.01 to 99 wt.%, more typically in the range 30 to 80 wt.%.

**[0211]** Other possible ingredients include anti-oxidants, colorants, flavorings and flavor enhancers, preservatives, salivary stimulating agents, cooling agents, co-solvents (including oils), emollients, bulking agents, anti-

foaming agents, surfactants and taste-masking agents.

[0212] Films in accordance with the invention are typically prepared by evaporative drying of thin aqueous films coated onto a peelable backing support or paper. This may be done in a drying oven or tunnel, typically a combined  
5 coater dryer, or by freeze-drying or vacuuming.

[0213] Solid formulations for oral administration may be formulated to be immediate and/or modified release. Modified release formulations include delayed-, sustained-, pulsed-, controlled-, targeted- and programmed-release.

[0214] Suitable modified release formulations for the purposes of the  
10 invention are described in U.S. Patent No. 6,106,864. Details of other suitable release technologies such as high energy dispersions and osmotic and coated particles are to be found in Verma et al., Pharmaceutical Technology On-line, 25(2), 1-14 (2001). The use of chewing gum to achieve controlled release is described in PCT Publication No. WO 00/35298.

15 [0215] The compounds of the invention may also be administered directly into the blood stream, into muscle, or into an internal organ. Suitable means for parenteral administration include intravenous, intraarterial, intraperitoneal, intrathecal, intraventricular, intraurethral, intrasternal, intracranial, intramuscular and subcutaneous. Suitable devices for parenteral  
20 administration include needle (including microneedle) injectors, needle-free injectors and infusion techniques.

[0216] Parenteral formulations are typically aqueous solutions which may contain excipients such as salts, carbohydrates and buffering agents (preferably to a pH of from 3 to 9), but, for some applications, they may be more  
25 suitably formulated as a sterile non-aqueous solution or as a dried form to be used in conjunction with a suitable vehicle such as sterile, pyrogen-free water.

[0217] The preparation of parenteral formulations under sterile conditions, for example, by lyophilization, may readily be accomplished using standard pharmaceutical techniques well known to those skilled in the art.

**[0218]** The solubility of compounds of Formula I used in the preparation of parenteral solutions may be increased by the use of appropriate formulation techniques, such as the incorporation of solubility-enhancing agents.

**[0219]** Formulations for parenteral administration may be formulated to  
5 be immediate and/or modified release. Modified release formulations include delayed-, sustained-, pulsed-, controlled-, targeted- and programmed-release. Thus compounds of the invention may be formulated as a solid, semi-solid, or thixotropic liquid for administration as an implanted depot providing modified release of the active compound. Examples of such formulations include drug-  
10 coated stents and poly(dl-lactic-coglycolic)acid (PGLA) microspheres.

**[0220]** The compounds of the invention may also be administered topically to the skin or mucosa, that is, dermally or transdermally. Typical formulations for this purpose include gels, hydrogels, lotions, solutions, creams, ointments, dusting powders, dressings, foams, films, skin patches, wafers,  
15 implants, sponges, fibers, bandages and microemulsions. Liposomes may also be used. Typical carriers include alcohol, water, mineral oil, liquid petrolatum, white petrolatum, glycerin, polyethylene glycol and propylene glycol. Penetration enhancers may be incorporated; see, e.g., Finnin and Morgan, J Pharm Sci, **88(10)**, 955-958 (1999).

20 **[0221]** Other means of topical administration include delivery by electroporation, iontophoresis, phonophoresis, sonophoresis and microneedle or needle-free (e.g. Powderject™, Bioject™, etc.) injection.

**[0222]** Formulations for topical administration may be formulated to be immediate and/or modified release. Modified release formulations include  
25 delayed-, sustained-, pulsed-, controlled-, targeted- and programmed-release.

**[0223]** The compounds of the invention can also be administered intranasally or by inhalation, typically in the form of a dry powder (either alone, as a mixture, for example, in a dry blend with lactose, or as a mixed component particle, for example, mixed with phospholipids, such as phosphatidylcholine)

from a dry powder inhaler or as an aerosol spray from a pressurized container, pump, spray, atomizer (preferably an atomizer using electrohydrodynamics to produce a fine mist), or nebulizer, with or without the use of a suitable propellant, such as 1,1,1,2-tetrafluoroethane or 1,1,1,2,3,3,3-heptafluoropropane. For intranasal use, the powder may comprise a

5 bioadhesive agent, for example, chitosan or cyclodextrin.

[0224] The pressurized container, pump, spray, atomizer, or nebulizer contains a solution or suspension of the compound(s) of the invention comprising, for example, ethanol, aqueous ethanol, or a suitable alternative

10 agent for dispersing, solubilizing, or extending release of the active, a propellant(s) as solvent and an optional surfactant, such as sorbitan trioleate, oleic acid, or an oligolactic acid.

[0225] Prior to use in a dry powder or suspension formulation, the drug product is micronized to a size suitable for delivery by inhalation (typically less

15 than 5  $\mu\text{m}$ ). This may be achieved by any appropriate comminuting method, such as spiral jet milling, fluid bed jet milling, supercritical fluid processing to form nanoparticles, high pressure homogenization, or spray drying.

[0226] Capsules (made, for example, from gelatin or hydroxypropylmethylcellulose), blisters and cartridges for use in an inhaler or

20 insufflator may be formulated to contain a powder mix of the compound of the invention, a suitable powder base such as lactose or starch and a performance modifier such as L-leucine, mannitol, or magnesium stearate. The lactose may be anhydrous or in the form of the monohydrate, preferably the latter. Other suitable excipients include dextran, glucose, maltose, sorbitol, xylitol, fructose,

25 sucrose and trehalose.

[0227] A suitable solution formulation for use in an atomizer using electrohydrodynamics to produce a fine mist may contain from 1  $\mu\text{g}$  to 20 mg of the compound of the invention per actuation and the actuation volume may vary from 1 to 100  $\mu\text{L}$ . A typical formulation may comprise a compound of Formula I,

propylene glycol, sterile water, ethanol and sodium chloride. Alternative solvents which may be used instead of propylene glycol include glycerol and polyethylene glycol.

5       **[0228]**     Suitable flavors, such as menthol and levomenthol, or sweeteners, such as saccharin or saccharin sodium, may be added to those formulations of the invention intended for inhaled/intranasal administration.

**[0229]**     Formulations for inhaled/intranasal administration may be formulated to be immediate and/or modified release using, for example, PGLA. Modified release formulations include delayed-, sustained-, pulsed-, controlled-,  
10    targeted- and programmed-release.

**[0230]**     In the case of dry powder inhalers and aerosols, the dosage unit is determined by means of a valve which delivers a metered amount. Units in accordance with the invention are typically arranged to administer a metered dose or "puff" containing from 20 to 1000 µg of the compound of Formula I. The  
15    overall daily dose will typically be in the range 100 µg to 10 mg which may be administered in a single dose or, more usually, as divided doses throughout the day, for example 2, 3, 4 or 8 times, giving for example, 1, 2 or 3 doses each time.

**[0231]**     The compounds of the invention may be administered rectally  
20    or vaginally, for example, in the form of a suppository, pessary, or enema. Cocoa butter is a traditional suppository base, but various alternatives may be used as appropriate.

**[0232]**     Formulations for rectal/vaginal administration may be formulated to be immediate and/or modified release. Modified release  
25    formulations include delayed-, sustained-, pulsed-, controlled-, targeted- and programmed-release.

**[0233]**     The compounds of the invention may also be administered directly to the eye or ear, typically in the form of drops of a micronized suspension or solution in isotonic, pH-adjusted, sterile saline. Other formulations

suitable for ocular and aural administration include ointments, biodegradable (e.g., absorbable gel sponges, collagen) and non-biodegradable (e.g., silicone) implants, wafers, lenses and particulate or vesicular systems, such as niosomes or liposomes. A polymer such as crossed-linked polyacrylic acid, polyvinylalcohol, hyaluronic acid, a cellulosic polymer, for example, hydroxypropylmethylcellulose, hydroxyethylcellulose, or methyl cellulose, or a heteropolysaccharide polymer, for example, gelan gum, may be incorporated together with a preservative, such as benzalkonium chloride. Such formulations may also be delivered by iontophoresis.

10       **[0234]**     Formulations for ocular/aural administration may be formulated to be immediate and/or modified release. Modified release formulations include delayed-, sustained-, pulsed-, controlled-, targeted- or programmed-release.

15       **[0235]**     The compounds of the invention may be combined with soluble macromolecular entities, such as cyclodextrin and suitable derivatives thereof or polyethylene glycol-containing polymers, in order to improve their solubility, dissolution rate, taste-masking, bioavailability and/or stability for use in any of the aforementioned modes of administration.

20       **[0236]**     Drug-cyclodextrin complexes, for example, are found to be generally useful for most dosage forms and administration routes. Both inclusion and non-inclusion complexes may be used. As an alternative to direct complexation with the drug, the cyclodextrin may be used as an auxiliary additive, i.e., as a carrier, diluent, or solubilizer. Most commonly used for these purposes are alpha-, beta- and gamma-cyclodextrins, such as those described in PCT Publication No. WO 98/55148.

25       **[0237]**     Inasmuch as it may be desirable to administer a combination of active compounds, for example, for the purpose of treating a particular disease or condition, it is within the scope of the present invention that two or more pharmaceutical compositions, at least one of which contains a compound in accordance with the invention, may conveniently be combined in the form of a

kit suitable for coadministration of the compositions.

**[0238]** Such kits comprises two or more separate pharmaceutical compositions, at least one of which contains a compound of Formula I in accordance with the invention, and means for separately retaining said  
5 compositions, such as a container, divided bottle, or divided foil packet. An example of such a kit is the familiar blister pack used for the packaging of tablets, capsules and the like.

**[0239]** Such kits are particularly suitable for administering different dosage forms, for example, oral and parenteral, for administering the separate  
10 compositions at different dosage intervals, or for titrating the separate compositions against one another. To assist compliance, the kit typically comprises directions for administration and may be provided with a so-called memory aid.

**[0240]** The amount of therapeutically active compounds that are  
15 administered and the dosage regimen for treating a disease condition with the compounds and/or compositions of this invention depends on a variety of factors, including the age, weight, sex and medical condition of the subject, the severity of the inflammation or inflammation related disorder, the route and frequency of administration, and the particular compound employed, and thus  
20 may vary widely. The pharmaceutical compositions may contain active ingredients in the range of about 0.1 to 1000 mg, preferably in the range of about 7.0 to 350 mg. A daily dose of about 0.01 to 100 mg/kg body weight, preferably between about 0.1 and about 50 mg/kg body weight and most preferably between about 0.5 to 30 mg/kg body weight, may be appropriate. The  
25 daily dose can be administered in one to four doses per day. In the case of skin conditions, it may be preferable to apply a topical preparation of compounds of this invention to the affected area two to four times a day.

**[0241]** It will be understood, however, that the specific dose level for any particular patient will depend upon a variety of factors including the activity

of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, route of administration, and rate of excretion, drug combination and the severity of the particular disease undergoing therapy.

[0242] These dosages are based on an average human subject  
5 having a weight of about 60 to 70 kg. The physician will readily be able to determine doses for subjects whose weight falls outside this range, such as infants and the elderly.

## EXAMPLES

25 [0255] Example 1: 3-amino-5-(2-hydroxyphenyl)-1-piperidin-3-  
ylpyrazin-2(1H)-one

[0256]

[0257] Step 1: Preparation of (2-(benzyloxy)phenyl)(1,3-dithian-2-yl)methanamine

[0258]

5 [0259] To a cooled (0°C) solution of 1,3-dithiane (1.31 g) in THF (10 mL) was added *n*-BuLi (1.9M in hexanes, 6.0 mL) slowly by syringe. The resulting mixture was stirred for 2 h at 0°C. In a separate flask, LHMDS (1.0M in THF, 10 mL) was slowly added to a cooled (0°C) solution of 2-benzyloxybenzaldehyde (2.10 g) in THF (20 mL). The resulting solution was

10 stirred 1 h at 0°C. The lithiated dithiane generated above was then added slowly via cannula. The reaction was allowed to warm to room temperature and stirred overnight, then quenched by addition of saturated aqueous NH<sub>4</sub>Cl. Phases were separated and the aqueous phase extracted with ethyl acetate. The combined organic phases were dried (MgSO<sub>4</sub>) and concentrated under reduced pressure.

15 The crude product was purified via flash chromatography (1.5:1 ethyl acetate:hexanes) to give the title compound as an extremely viscous oil.

[0260] Step 2: Preparation of methyl ((2-(benzyloxy)phenyl)(1,3-dithian-2-yl)methylcarbamoyl)formate

[0261]

20

[0262] A mixture of (2-(benzyloxy)phenyl)(1,3-dithian-2-

yl)methanamine from Step 1 (2.4 g) and dimethyl oxalate (2.6 g) was heated at 55°C in methanol (50 mL) under N<sub>2</sub> for 60.5 h. The reaction mixture was then diluted with water (50 mL) and the white solid product isolated by vacuum filtration, washing repeatedly with 1:1 methanol:water. Drying in a vacuum oven  
5 at 70°C provided the title compound as a white powdery solid.

**[0263]** Step 3: Preparation of benzyl 4-[[[2-(benzyloxy)phenyl](1,3-dithian-2-yl)methyl]amino](oxo)acetyl]amino]piperidine-1-carboxylate

**[0264]**

**[0265]** A mixture of methyl ((2-(benzyloxy)phenyl)(1,3-dithian-2-yl)methylcarbamoyl)formate from Step 2 (2.09 g) and 1-benzyloxycarbonyl-3-aminopiperidine (1.405 g) in ethyl acetate (25 mL) was heated at 60°C overnight, then at 75°C for 5.5 h. After cooling to room temperature, the reaction mixture was diluted with hexanes (25 mL) and a white solid isolated by vacuum filtration, washing repeatedly with 1:1 hexanes:ethyl acetate. Owing to the  
15 presence of the desired product in the filtrate, the filtrate was concentrated and combined with the filtered solid. The title compound was purified by flash chromatography (20:1 to 10:1 dichloromethane:acetonitrile) to give a white solid.

**[0266]** Step 4: Preparation of benzyl 4-[[[1-[2-(benzyloxy)phenyl]-2-oxoethyl]amino](oxo)acetyl]amino]piperidine-1-carboxylate

[0267]

[0268] To a cooled (-30°C) solution of benzyl 4-[[[2-

An additional 1 mL of the trifluoroacetic acid:trifluoroacetic anhydride:acetic acid solution was added and the mixture heated an additional 25 min at 110°C in the microwave (see Fleitz et al. (2000) Synth. Commun. 30, p. 3171-80). The reaction mixture was then concentrated under reduced pressure. The crude oil was diluted with a small

The resulting mixture was heated 1.75 h at 120°C in the microwave. The reaction was quenched by addition of saturated aqueous sodium bicarbonate (25 mL) and diluted with dichloromethane (50 mL) and saturated aqueous sodium bicarbonate (25 mL). Phases were separated and the aqueous phase extracted three times with dichloromethane. The combined organic phases were dried (MgSO<sub>4</sub>) and concentrated under reduced pressure. The title compound was purified by flash chromatography (2.5:1 to 2:1 hexanes:ethyl acetate) to give a yellow powder.

**[0326]    IKK-1 SAM Enzyme Assay**

**[0327]**    IKK-1 kinase activity was measured using a biotinylated IκBα peptide (Gly-Leu-Lys-Lys-Glu-Arg-Leu-Leu-Asp-Asp-Arg-His-Asp-Ser<sub>32</sub>-Gly-Leu-Asp-Ser<sub>36</sub>-Met-Lys-Asp-Glu-Glu), a SAM<sup>2</sup>™ 96 Biotin capture plate and a vacuum system. The standard reaction mixture contained 5 μM biotinylated IκBα peptide, 1 μM [γ-<sup>33</sup>P] ATP (about 1 X 10<sup>5</sup> cpm), 1 mM DTT, 50 mM KCl, 2 mM MgCl<sub>2</sub>, 2 mM MnCl<sub>2</sub>, 10 mM NaF, 25 mM Hepes buffer, pH. 7.6 and enzyme solution (1-10 μl) in a final volume of 50 μl. After incubation at 25°C for 30 min, 25 μl of the reaction mixture was withdrawn and added to a SAM<sup>2</sup>™ 96 Biotin capture 96-well plate. Each well was then washed successively with 800 μl 2 M NaCl, 1.2 ml of NaCl containing 1% H<sub>3</sub>PO<sub>4</sub>, 400 μl H<sub>2</sub>O, and 200 μl 95% ethanol. The plate was allowed to dry in a hood at 25°C for 1 hr and then 25 μl of scintillation fluid (Microscint 20) was added to each well. Incorporation of [γ-<sup>33</sup>P] ATP was measured using a Top-Count NXT (Packard). Under each assay condition, the degree of phosphorylation of IκBα peptide substrate was linear with time and concentration for all purified enzymes. Results from the biotinylated peptide assay were confirmed by SDS-PAGE analysis of kinase reaction utilizing a GST-IκBα<sub>1-54</sub> and [γ-<sup>32</sup>P] ATP. The resulting radiolabeled substrate was quantitated by Phosphorimager (Molecular Dynamics). An ion exchange resin assay was also employed using [γ-<sup>33</sup>P] ATP and GST-IκBα<sub>1-54</sub> fusion protein as the substrates. Each assay system yielded consistent results in regard to K<sub>m</sub> and specific activities for each of the purified kinase isoforms. One unit of enzyme activity was defined as the amount required to catalyze the transfer of 1 nmole of phosphate from ATP to IκBα peptide per min. Specific activity was expressed as units per mg of protein. For experiments related to K<sub>m</sub> determination of purified enzymes, various concentrations of ATP or IκBα peptide were used in the assay at either a fixed IκBα or ATP concentration. For IκBα peptide K<sub>m</sub>, assays were carried out with 0.1 μg of enzyme, 5 μM ATP and IκBα peptide from 0.5 to 20 μM. For ATP K<sub>m</sub>, assays were carried out with 0.1 μg

of enzyme, 10  $\mu$ M I $\kappa$ B $\alpha$  peptide and ATP from 0.1 to 10  $\mu$ M. For  $K_m$  determination of rhIKK-1 homodimer, due to its low activity and higher  $K_m$  for I $\kappa$ B $\alpha$  peptide, rhIKK-1 homodimer (0.3  $\mu$ g) was assayed with 125  $\mu$ M I $\kappa$ B $\alpha$  peptide and a 5-fold higher specific activity of ATP (from 0.1 to 10  $\mu$ M) for ATP  $K_m$  experiments and a  
 5 5-fold higher specific activity of 5  $\mu$ M ATP and I $\kappa$ B $\alpha$  peptide (from 5 to 200  $\mu$ M) for I $\kappa$ B $\alpha$  peptide  $K_m$  experiments.

**[0328] IKK heterodimer Resin Enzyme Assay**

**[0329]** IKK heterodimer kinase activity was measured using a biotinylated I $\kappa$ B $\alpha$  peptide (Gly-Leu-Lys-Lys-Glu-Arg-Leu-Leu-Asp-Asp-Arg-His-  
 10 Asp-Ser<sub>32</sub>-Gly-Leu-Asp-Ser<sub>36</sub>-Met-Lys-Asp-Glu-Glu) (American Peptide Co.). 20  $\mu$ l of the standard reaction mixture contained 5  $\mu$ M biotinylated I $\kappa$ B $\alpha$  peptide, 0.1  $\mu$ Ci/reaction [ $\gamma$ -<sup>33</sup>P] ATP (Amersham) (about 1 X 10<sup>5</sup> cpm), 1  $\mu$ M ATP (Sigma), 1 mM DTT (Sigma), 2 mM MgCl<sub>2</sub> (Sigma), 2 mM MnCl<sub>2</sub> (Sigma), 10 mM NaF (Sigma), 25 mM Hepes (Sigma) buffer, pH 7.6 and 20  $\mu$ l enzyme solution and 10  
 15  $\mu$ l inhibitor in a final volume of 50  $\mu$ l. After incubation at 25°C for 30 min, 150  $\mu$ l resin (Dowex anion-exchange resin AG1X8 200-400 mesh) in 900 mM formate, pH 3.0 was added to each well to stop the reaction. Resin was allowed to settle for one hour and 50  $\mu$ l of supernatant was removed to a Micolite-2 flat bottom plate (Dynex). 150  $\mu$ l of scintillation fluid (Microscint 40) (Packard) was added to  
 20 each well. Incorporation of [ $\gamma$ -<sup>33</sup>P] ATP was measured using a Top-Count NXT (Packard).
